Replicable and transcriptionally active plasmid carrying signal peptide for specific target - useful for site directed mutagenesis and molecular therapy of genetic diseases.

Disclosure; Col 11; 24pp; German.

Two modified oligonucleotides (introducing Petl and XhoI sites) were used to amplify a region of the human mitochondrial (mt) genome contg. the light strand promoter, meDNA ori of the heavy strand, CSB's ("conserved sequence blocks") and a regulation site for DNA replication. Behind this fragment (5' direction) a synthetic multiple cloning site was introduced, generating a product with overhanism ends. The synthetic region also introduced a bidirectional mt transcription termination sequence. The amplification product, synthetic fragment and pBluescript were ligated and recombinant plasmid 1 (AAT12115) was produced. Human mt 16S rRNA (differing from the native RNA only in having a modified nucleotide) was isolated by PCR from chloramphenical resistant HeLa cells and inserted into plasmid 1 to form plasmid 2 (AAT12115). The cloned insert was

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in neuronal issue of a first animal expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a
               oligonuclectides, one of which carried the required signal peptide (the present sequence). The cyclised product was purified by treatment with exonuclease III. In a modification, the signal peptide was attached after cyclisation. The new plasmids were able to impart chloramphenicol resistance to otherwise sensitive B lymphocytes and fibroblasts. Similar plasmids without a signal peptide could not do this. The plasmids can be introduced into eukaryotic cells, esp. for site-directed mutagenesis or molecular therapy of genetic diseases, targetting nucleic acid in cells or their organelas via the protein transport route. compound that regulates the activity of one or more of the
polynucleotides, a method for producing a pharmaceutical composition, a
method for identifying a compound or small molecule that regulates the
activity in an animal of one or more of the polypeptides given in the
specification, a method for identifying a compound useful in treating
compainance or more
composition to more
compound that
compound that
compound that segmental nerve injury (chung), chronic constriction
composition and spared nerve injury (SNI) in an animal (e.g. gene
compound that proposition to the segmence presented is a rat protein (shown in Table 2 of
the specification) which is differentially expressed during pain. Note:
The sequence data for this patent did not form part of the printed
compound that sequence presented in a new part of the printed
composition, but was obtained in electronic form directly from WIPO at
composition to the proposition of the printed composition of the printed com
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymucleotides a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polymeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymuclectide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the sequence data for this patent did not form mark of the printed specification, but was obtained in electronic form directly from WIPO at the wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a recombinant vector for expressing a fused protein containing a fused gene in which a base sequence defining a transfer signal peptide to small cellular organs having an extranuclear gene is combined with a base sequence defining the amino acid sequence of a restriction enzyme recognising a defined base sequence. The vector is used for decomposing an extranuclear gene of a nonhuman organism. The present sequence represents the signal peptide of rat mitochondrial ornithine transcarbamylase (MOT) which may be used in the vector of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rat; signal peptide; ornithine transcarbamylase; MOT; recombinant vector;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A recombinant vector for expressing a fused protein, useful for decomposing an extranuclear gene of a nonhuman organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .,

The invention discloses a composition comprising two or more isolated rate or human polynuclectides or a polynuclectide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynuclectide, a host cell comprising the vector, a method for identifying a nuclectide sequence witch is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynuclectide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound for identifying a compound or small molecule that regulates the activity of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymclection in treating modulates its activity is useful for preparing a medicament for treating modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction
                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, or human polynucleotides or a polynucleotide which represents a fragment, claimed are a vector comprising the nucleic acid sequence. Also comprising the vector comprising the nucleic acid sequence which is differentially regulated in an animal subjected to pain and a which is differentially regulated in an animal subjected to pain and a nethod for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the
                                                                                                                                                                                                                1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                Gaps

The vector is used for decomposing an extranuclear gene of a nonhuman organism. The present sequence represents the signal peptide of human mitochondrial
                                                                                                                                                                                                                                                                                      ï
specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The specification describes a method for functionally complementing one or more defects, mutations, or deletions in a mitochondrial genome of a cell having a nuclear genome. The method is used for treating a disease or disorder that arises from deletion of the protein-encoding genes of the mitochondrial genome. Alternatively, the method is used for treating ca disease or disorder that arises from one or more defects, deletions or mutations in mitochondrial genes encoding tibosomes or tRNA for transcription and translation in the mitochondrial encephalmypathy with can be ameliorated are mitochondrial encephalmypathy with lactic acidosis and stroke-like episodes, Leber hereditary optic neuropathy, myoclonic epilepsy with ragged-red fibres, neurogenic neuropathy, myoclonic epilepsy with ragged-red fibres, neurogenic concerns paraxia, retinitis pigmentosa, Kearns-Sayre syndrome, Leigh syndrome, Pearson Marrow pancreas syndrome, aminoglycoside-cassociated deafness, diabetes with deafness, leukodystrophy with hypotomia, autism with seizures, sudden infant death syndrome with hypotomia autism with seizures, blindness with other aring loss, refractory infantile reflux with carnitine deficiency, migraines (associated with hearing loss, strokes, or diabetes), early hearing loss, refractory infantile reflux with carnitine deficiency, migraines (associated with hearing loss, strokes, or diabetes), early hearing loss, refractory infantile reflux with carnitine deficiency, migraines (associated with hearing loss, strokes, or diabetes), early hearing loss, strokes, or diabetes), cardy and dystonia, nonvalvular hypertrophic cardiomyopathy before age 50 and chronic pancreatitis with stroke-like episodes. The present sequence is encoded

by plasmid pUOATP2. Plasmid pUOATP2 comprises a mutant oligomycin-
resistant ATPase 6 mitochondrial gene derived from Chinese hameter ovary
(CHO) cells linked to ornithine transcarbamylase DNA sequence. It is used
for targeting the protein to the mitochondria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for preparing a protein which interacts with the heat shock protein HSP47. The method involves the two-hybrid screening method using the HSP47 gene and a mammalian cDNA library. The HSP47 interacting proteins are useful for the diagnosis and treatment of diseases caused by an increase or decrease in activity of HSP47. The present sequence was used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Using the two-hybrid screening method to prepare proteins which interact with the heat shock protein HSP47.

The antibody is esp. a single chain antibody in which the heavy and light chain variable regions are joined via a hydrophilic linker peptide. Localisation sequences are pref. included in the constructs. The sequence AAR48260 is a mitochondrial matrix retention signal. (Updated on 25-MAR-2003 to correct PN field.)

Intracellular binding to a desired target by an intracellularly expressed antibody (i.e. an intrabody) can be used to knock out multiple locuses of immunoandulatory receptor molecules (IRMs), so that the expression of multiple major histocompatibility (MHC) molecules is blocked. This selective targeting of IRMs, their pathways or components, can be used to selectively regulate the immune system by controlling expression of these molecules and preventing an undesired immune response in a cell. Any component of the MHC pathway or the MHC assembly line or antigen presentation can be targeted. Intrabodies can be used to knock out the immune response in a particular tissue or portion of the body to prepare it for cell or tissue transplantation. Alternatively, an organ for transplantation can be perfused with the intrabody ex vivo. The transplantation can be perfused with the intrabody ex vivo. The intracellular localisation signal to facilitate interception of expressed intrabodies and diabodies. The intrabodies also comprise and intracellular localisation signal to facilitate interception of expressed antibody would comprise a leader sequence and an endoplasmic reticulum (ER) or Golgi apparatus retention signal. This peptide is a localisation and an analysismic reticulum or and an analysismic median and an endoplasmic reticulum or and an analysismic reticulum or and an analysismic median and an endoplasmic reticulum or and an analysismic median and an endoplasmic median and an en
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Regulator; transcription; cell death; phenotype; molecular scaffold; gene therapy; cancer; cardiovascular disease; arrhythmia; heart failure;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invertion discisses a method for induces activation of a target transcriptional regulatory region in a host cell. The method comprises transcriptional regulatory region in a host cell. The method comprises to providing a population of eukaryotic host cells capable of expressing the polypeptide, introducing into the host cell a library of polymucleotides encoding the polypeptides, permitting expression of the polypeptides and then recovering them from the host cells. The target transcriptional regulatory region is operably associated with a polymucleotide encoding a company region is operably associated with a polymucleotide encoding the product, the expression of which results in host cell death or cause the product is expressed upon activation of target transcriptional regulatory region. Each candidate regulator polypeptide and molecular scaffold fused to the peptide so that condidate peptide is displayed on the surface of the candidate regulator candidate peptide is displayed on the surface of the candidate regulator candidate peptide is displayed on the surface of the candidate regulator collecules, such as polypeptides, which directly or indirectly induce or suppress the transcriptional activation of a target transcriptional regulatory region in a eukaryotic host cell. These candidates the transcriptional activation of a target transcriptional heart failure, ischaemia), obesity, neurodegenerative (e.g. arrhythmia, heart failure, ischaemia), obesity, neurodegenerative diseases (e.g. Alzhaimer's disease), bone pathologies, dermaclogic diseases (e.g. Alzhaimer's disease), bone pathologies, dermaclogic diseases (e.g. psoriasis), infections (e.g viral, bacterial), acquired immunodeficiency syndrome (AIDS), in cosmetic applications and in wound block antibiotic transport mechanisms, in drug toxicities and drug cells also useful in screening regulator molecules and drugs. The method is also useful in screening edevalopmental drugs. It may also be used to simmunoscipic resistance applications and in improving t The invention discloses a method for identifying polynucleotides encoding allergic response and in biotechnology applications. The sequences presented in ABG92946-ABG93029 are examples of regulator polypeptides

Selecting polynucleotides encoding an intracellular immunoglobulin which induces a modified phenotype in a eukaryotic host cell, by introducing library of polynucleotides encoding immunoglobulin subunit polypeptides.

WPI; 2003-103408/09

Disclosure; Page 44; 257pp; English.

(i) The method comprises introducing into (I) a first and second library of PNB encoding, through operable association with a transcriptional control region, first and second intracellular immunoglobulin subunit polypeptides, respectively. The method is useful for selecting colynucleotides which encode an intracellular immunoglobulin molecule, or fragment. The method is useful e.g. for identifying polynucleotides which subject to a subject to immunoglobulin molecules that regulate LDL and HDL metabolism; in skin biology applications; and in regulating or inhibiting keloid formation. ABZ22379 to ABZ22449 and ABPS6536 to ABPS6618 represent sequences used in the exemplification of the present invention The present invention describes a method for selecting polynucleotides (PNB) encoding an intracellular immunoslobulin molecule or its fragment whose expression induces a modified phenotype in a eukaryptic host cell (I). The method comprises introducing into (I) a first and second library

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a controlled release drug delivery system.

Target cells in a patient are transformed with an expression construct encoding an antibody (particularly a single chain antibody) to the darig to be delivered. The antibody contains a medulator of intracellular half-life; this can either be a stabilising or destabilising residue located in the N-terminus after the initial methionine, or a peptide ("stabilion") containing a stabilising residue linked to the antibody N-terminus via a protease cleavage site. On administration of the drug, the antibody binds the drug, localising it at the target cells but maintraining it in an inactive state. As the antibody is degraded (the timescale for which is dependent upon the N-terminal or stabilon amino acids), the drug is released at its site of action where it can exert its effects. The antibody encoded by the expression construct (and therefore the antibody accoded by the expression construct (and therefore the antibody accoded by the expression construct (and therefore the cancent of the antibody accoded by the expression construct (and therefore the patients with a variety of conditions such as diabetes, autoimmune signals. The novel method of the invention causes a drug to become almost immediately localised at its site of action in an inactive form

The N-terminus of the single-chain antibody is linked to a stabilising fusion peptide, referred to as a stabilon, which increases stability of the antibody against proteolysis in vivo. Degradation of the antibody may be modulated by linking the stabilon to the antibody through a protease-sensitive linker region. The stabilon is removed upon induction of expression of a specific restriction protease by means of an inducible promoter, and this renders the antibody susceptible to proteolysis by the
where it accumulates. Once released by antibody degradation, the drug is at an effective concentration only at the target site, with very little free drug being available in the rest of the body. The system of the invention therefore reduces the side effects caused by therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mitochondrial matrix localisation sequence; single-chain antibody; stabilon; stabilising fusion peptide; vaccine; gene therapy; protein degradation modulation; protein stability; Alzheimer's disease.
                                                                                                                                     agents, and also provides economic benefits as a smaller amount can be administered to the patient. Sequences AAB22835- AAB22837 and AAB22839-B22857 represent subcellular localisation sequences which can incorporated into a drug-specific antibody used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modulating degradability of protein or peptide useful for gene therapy involving antibodies, comprises altering a gene at the N terminus to render protein or peptide metabolically stable.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mycobacterial DNA vectors containing reporter constructs - for identifying coding or promoter sequences involved in infection-associated protein expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequences AAY04742-Y05000 and AAY07201-Y07204 represent secreted proteins from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection
N-end rule pathway. This method for regulating protein stability allows removal of the antibody after it has bound to its target antigen. Stabilised recombinant proteins may be used in gene therapy for the treatment of disorders such as Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention relates to the isolation of novel human enzyme polypeptides, and the CDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. anthritis), neurological disorders (e.g. AIDS) autoimmune disorders (e.g. asthma), cardiovascular disorders (e.g. AIDS) autoimmune disorders (e.g. asthma), cardiovascular disorders (e.g. AIDS) autoimmune disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. influencial) influencial. The polymucleotides of the invention can also be used in gene therapy. AAU22915-AAU23814 represent the novel human enzyme polypeptides of the invention. Note: The sequence the novel human enzyme polypeptides of the invention. Note: The sequence was obtained in electronic format directly from WIPO at the print sequence the wippoint format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           10; Indels 17; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the genome of bacteriophage RN 378. The invention also describes (1) an isolated nucleic acid which encodes a polypeptide obtainable from bacteriophage RN 378 (11); (3) a DNA construct (III) comprising isolated bacteriophage RN 378 (11); (3) a DNA construct (III) comprising operatively linked to a regulatory sequence; (4) a host cell comprising (III); and (5) an isolated polypeptide (IV) obtainable from (II); its active derivative or fragment. Bacteriophage RN 378 is useful for active derivative or fragment. Bacteriophage RN 378 is useful for producing thermophilic enzymes useful in DNA research and commercial settings (e.g. proteases and lipases used in washing powder, hydrolytic enzymes useful in the manufacture of encoded polypeptide, as probes for isolating homologous sequences (e.g. from other bacteriophage in a species), as well as for detecting the presence of the bacteriophage in a culture of host cells. The polypeptides can be used as a molecular weight marker on SDS-PAGE gels or on molecular sieve gel filtration columns. Because the host organism of the RN378 bacteriophage are significantly more thermostable than those of other (e.g. mesophilic) bacteriophage, such as the T4 bacteriophage of Escherichia coll. The entance and proteins of RN378 bacteriophage are significantly columns are the enzymes and proteins of RN378 bacteriophage are significantly columns are the enzymes and proteins of RN378 bacteriophage are significantly columns the enzymes and proteins of RN378 bacteriophage are significantly contens are the enzymes and proteins which would be prohibitive for other enzymes, thus increasing the range of conditions which can be employed not only in DNA research but also in commercial settings
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel isolated nucleic molecule (I) comprising

of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC60610-ACC61944 respectively. The complexes are Abr52568-ABR53903 and ACC60610-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful of disponsing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not repersented in the printed specification, but is based on sequence information supplied by the European Patent Office. The complete document is available on CD-ROM
                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to multiprotein complexes from eukaryotes. The invention relates to novel protein complexes comprising a first and a second protein, or its derivative, fragment, homologue or variant. The second protein are selected from given protein complexes, which are not defined in the specification. The variants are encoded by nucleic acids that the specification. The variants are encoded by nucleic acids that the specification complexes are useful as targets for an active agent of a pharmaceutical. These are useful as targets for an active agent of a pharmaceutical. These are useful in diagnosing or useful as drugs targets for the treatment or preventing of a disease or disorder. The complexes and methods above are useful in diagnosing or screening for the presence of a disease or disorder or a predisposition for developing a disease or disorder in a subject. These are also useful in screening for a drug for treatment or prevention of a disease or disorder. The molecule that modulates the amount, activity or protein components of the complex is useful for the manufacture of a medicament or prevention of a disease or disorder. This sequence corresponds to a protein of the invention. (Note: the sequence data for this patent did not form part of the printed specification but was to be a protein of format).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ξ,

                                                                                                                                                         represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54577 to AAZ54576 and AAZ54615, represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54577 to AAZ54575 and AAZ54615. To AAZ54577 to AAZ54575 and AAZ5646 to AAZ55473. represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisseria bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria Jacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy.

vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producting an E. faecalis polypeptide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector comprising the nucleic acid and a cell comprising the recombinant vector. The polynucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for represents or treating Enterococcus faecalis infection. This sequence represents an E. faecalis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial arrepts, as templates for antibacterial drugs, including anti-P. aeruginosa derived peptides for antibacterial drugs, production of P. aeruginosa derived peptides or polypeptides, as target components for diagnosis and/or treamment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The

                                                                                                                                                                                   AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY55941 represent novel Neisseria meningitis and N. gonorrheae polymucleotides and polypeptides. AAZ54576 and AAZ54616 to AAZ54713 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polymucleotides, antibodies and compositions of the immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria, or to raise antibodies. They may also be used to screen for agonists or antegonists, which may themselves have use as antibacterial agents. The polymucleotides of the invention may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nucleic acid comprising a sequence encoding an Enterococcus fecalis ypeptide, useful for preparing a composition for diagnosing or

identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational four discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Entercoccus faecium encoding an Entercoccus faecium polypeptide having one of 10 fully defined sequences given in the (or comprising 40 sequential nucleotides chosen from any of the nucleic acids, its complement or sequences hybridising to it). Also included are a recomplement or sequences hybridising to it). Also included are a recomplement vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the evetor and a single-stranded probe comprising the nucleic acid operably linked to chosen from 3654 disclosed sequences encoding 3654 disclosed sequences encoding 3654 disclosed proteins. The nucleic acids is useful for diagnosing pathological conditions resulting from E faecium bacterial infection (e.g. urinary tract infection, bacteraemia, endocarditis, wounds and abdominal-pelvic infection) and for screening drugs such as agonists and antagonists. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid derived from Enterococcus faecium encoding an Enterococcus faecium polypeptide useful for detection, prevention and treatment of a pathological condition resulting from a bacterial

   ä
nucleic acid is useful for recombinant production of Candida albicans -derived peptides or antisense polypeptides. Pharmaceutical compositions and vaccines containing the nucleic acid are useful for preventing or treating Enterococcus faceium infections. The present sequence represents one if the disclosed E. faccium proteins.
                                                                                                                                                                                                                                                       Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), porteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                           The gene product may be expressed from an E.coli plasmid expression system for the mass production of various kinds of salmon hypophysis cerebri hormones eg. ACTH; beta-,gamma-LPH; alpha-,beta-MSH; CLIP; beta endorphin etc. (Updated on S-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                   DNA plasmid and its prepn. - having de:oxy:ribonucleotide sequence to code salmon-hypophysis cerebri-hormone (precursor).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Drosophila; developmental biology; cell signalling; insecticide; pharmaceutical.

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the plypeptides encoded by the genes are used for detection/identification of P. luminescens. e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. ceombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The tharapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-ended toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence actors and for identifying targets of human diseases for which P. cluminescens is a model (particularly plaque and whooping cough). This sequence represents one of the isolated P. luminescens

polypeptides. The invention also relates to a recombinant expression vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an B. faecalis polypeptide, an isolated nucleic acid comprising comprising the nucleic acid and a cell comprising the recombinant vector. The polynucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for diagnosing or treating Enterococcus faecalis infection. This sequence represents an E. faecalis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, protease, protease inhibitor; protease and protease inhibitor; protease ppp., identification; diagnosis; anti-human immunodeficiency virus; HIV; antidiabetic; immunostimulant; immunomodulator; antidinflammatory; antithyroid; immunosuppressive, nephrotropic; antigout; thyronimetic; cytostatic; antibacterial; fungicide; protozoacide; antiarterioscleroric; antipsorfatic; virucide; hepstotropic; gene therapy; autoimmune disorder; inflammatory disorder; AIDS; DiGeorge's syndrome; severe combined immunodeficiency disease; SCID; Chediak-Higashi syndrome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA 88020072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

AAF81714 to AAF81740 encode the human proteases and protease inhibitors (PPIMS) given in AAB74668 to AAB74694. The PPIMS can have activities such as: anti-human immunodeficiency virus (HVV); antidiabetic; antithyroid; immunostimulant; immunomodulator; antiinflammatory; immunosuppressive; nephrotropic; antigout; thyronimetic; cytostatic; antibacterial; fungicide; protozoacide; antiarteriosclerotic; antiatherosclerotic; virucide; antiporiatic; and hepatotropic. PPIM polymucleotide and protein sequences can be used in the diagnosis, treatment and prevention of autoimmune/inflammatory discorders such as AIDS, DiGeorge's syndrome, severe combined immunodeficiency disease (SCID), Chediak-Higashi syndrome, Cushing's disease, Addison's disease, autoimmune thyroiditis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Crohn's disease, diabetes mellitus, Good pasture's syndrome, gout, Grave's disease, Hashimoto's thyroiditis, Sjogren's syndrome, Werner's syndrome, viral, bacterial, fungal, parasitic, protozoal, and helminthic infections and claim proliferative disorder such as arteriosclerosis, attherosclerosis, cirrhosis, hepatitis, psoriasis and cancer. PPIM polymucleotide sequences can be used in somatic or germline gene therapy
             Crohn's disease; diabetes mellitus; Good pasture's syndrome; infection; Grave's diseases; Hashimoto's thyroiditis; Sjogren's syndrome; cancer; Werner's syndrome; cell proliferative disorder; arteriosclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and in diagnosis of diseases. They can also be used in generating hybridisation probes useful in mapping the naturally occurring genomic sequences and in molecular biology techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New protease (inhibitors) useful for diagnosis and treatment of autoimmune/inflammatory disorders such as acquired immunodeficiency syndrome, Cushing's disease, Addison's disease and cell proliferative disorders such as cancer.
                                                                                                                                                                                                                                                                                                                                                                     Lu DAM;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
 Cushing's disease; Addison's disease; autoimmune thyroiditis; gout;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         5;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM0529-ADM06201 encoded by the polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             are useful as pharmaceutical agents. The present sequence represents a
protein sequence of the invention.

(HUMA-) HUMAN GENOME SCI INC

Birse CE, Rosen CA;

WPI; 2002-122018/16. N-PSDB; ABL90148.

Novel 1405 isolated polypeptides, useful for diagnosis, treatment and prevention of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders.

Claim 11; SEQ ID NO 2115; 2081pp + Sequence Listing; English.

The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing cardiovascular disorders such as myocardial ischaemias; (d) wound healing ; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Sequence 29653, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

APPLICATION: MUCLEIC ACID ANINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

FILE REPERENCE: 107196.136

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

LENGTH: 274
                                                                                                                                                                                              Sequence 7879, Application US/09489039A

Patent No. 6610836

GENERAL INFORMATION:
APPLICANT: GATY BECTON et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS
FILE REFERENCE: 2709.2004001
CURRENT APPLICATION NUMBER: US/09/489,039A
CURRENT FILING DATE: 1999-01.27

Patent No. 6605709
GENERAL INPORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PROTEUS MIRABIL
TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 2709.1002-001
CURRENT APPLICATION NUMBER: US/09/543,681A
CURRENT FILING DATE: 2000-04-05
PRIOR FILING DATE: 1999-04-09
NUMBER OF SEQ ID NOS: 8344
SEQ ID NO 4698
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 25705, Application US/09252991A

Patent No. 6551795
GENERAL INFORMATION:
TTLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AERGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AERGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/252,991A

Sequence 5142, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:

APPLICANT Homburger et al.

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster

TITLE OF INVENTION: Nucleic acids and proteins of Consophila melanogaster

TITLE OF INVENTION: 1399-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 51442

LENGTH: 318
